Semiconductor Company Pitch: Remaining Boards

Drafts for tasks 2, 4, 5, 6 and 7. Tasks 1 and 3 are already completed in canva.

2. Competitor Comparison Board

Facts come from each company's official pages and reports, checked October 28, 2026. "Not found on official sources" means it was not verified in the materials reviewed, not that the company lacks it. Spot-check the source links below before printing.

	Winstek	ASE	Sigurd	PTI	KYEC	Our Company
Semiconductor services	Wafer and IC testing, wafer bumping, backend processing, verification analysis	Packaging and testing	Packaging and testing	Packaging and testing	Testing; packaging not listed as a core service	AI chip testing and inspection, plus training
Packaging	Wafer bumping and wafer-level chip scale packaging	Flip-chip, wafer-level, fan-out, SiP, 2.5D/3D integration, wire bonding, bumping	WLCSP, bumping, flip-chip, window BGA	Wire bonding, flip-chip, wafer-level, SiP, 2.5D/3D, fan-out panel-level	Not found on official sources as a core service	Not our focus
Testing	Wafer sort, final test and post-test for mixed-signal, digital, optical and RF devices	Wafer probing, final, functional, parametric and reliability testing	Wafer sort, final test, test engineering, device characterization, failure analysis	Chip probing, IC testing, final testing, burn-in, system-level testing	Wafer probing, final testing, burn-in, system-level testing	AI-model testing on chips
AI service	Not found on official sources	AI-assisted test operations	AI and machine learning for test	Computer-vision defect detection, AI analysis	AI monitoring and yield monitoring	Core AI testing branch

	Winstek	ASE	Sigurd	PTI	KYEC	Our Company
		and yield optimization	production and predictive analysis	of test data, predictive maintenance	in its test-data system	
Training	Not found on official sources	University partnerships, internships, scholarships, talent programs	Not found on official sources	AI Jade Project (employees) and AI Talents Training Camp (college students)	Employee training systems and an e-learning academy	Core training center
Customers / industries	Not found on official sources	AI, high-performance computing, automotive, communications, mobile, consumer	HPC, wireless, mobile, automotive, medical, satellite, IoT, AI, consumer	AI, HPC, automotive electronics, IoT, memory	AI/HPC chips, communications, consumer, automotive, industrial	Testing firms, IC designers, schools
Technology	Copper pillar bump, WLCSP, heterogeneous bump, backside metallization	VIPack, SiP, fan-out, flip-chip, 2.5D/3D IC, TSV	WLCSP, Cu-pillar bumping, flip-chip, RF and silicon photonics testing	2.5D/3D IC, fan-out panel-level, HBM, silicon photonics	High-power burn-in, system-level test, test-equipment development	AI inspection and testing methods
Ownership and background	Founded 2000; subsidiary of Sigurd Group since 2017	Established 1984; wholly owned by ASE Technology Holding since 2018	Parent of Winstek; no parent company identified in reviewed sources	Founded 1997; operations in Taiwan and Japan	Founded May 1987; listed on Taiwan Stock Exchange as 2449	New company

	Winstek	ASE	Sigurd	PTI	KYEC	Our Company
Main strength	Testing, bumping and failure analysis in one place	Broad, integrated packaging and testing including advanced integration	Packaging and testing plus custom test engineering and smart manufacturing	Memory packaging and testing plus advanced packaging development	Specialized chip testing with in-house test-equipment development	Combines testing, AI and talent supply

Board conclusion line: The established companies cover testing and packaging. Our company fits in the space beside them: AI-based inspection and talent development, working with them rather than replacing them.

Sources for the board (official pages, checked October 28, 2026):

- ASE: about, group overview, financials, test services, 2024 sustainability report
- Sigurd: about, test solutions, smart manufacturing
- PTI: about, sustainability report material, education foundation
- KYEC: company profile, test data and AI monitoring, technology innovation
- Winstek: official website

4. Risk and Backup-Plan Board

Levels: Green = Low, Yellow = Medium, Red = High.

Risk	Effect	Backup Plan	Level
Workers and engineers (talent crowding-out)	Cannot staff testing lines; wages rise	Training center for students, industry-academia ties with NTU/NTHU, recruiting overseas talent	🟡(Medium)
Equipment cost	Heavy upfront spending slows launch	Start small, lease or share equipment, buy more as revenue grows	🔴 (High)
Supply chain	Delays in chips for AI testing	Several suppliers, keep a small buffer stock	🟡 (Medium)
Materials (helium, hydrogen bromide, Middle East disruption)	Material shortages or price spikes	Alternative suppliers, store reserves, long-term contracts	🟡 (Medium)

Risk	Effect	Backup Plan	Level
Competition (Taiwan and U.S. self-reliance push)	Larger firms take customers	Focus on the AI-and-training niche, build partnerships	🟡 (Medium)
Finance	Cash runs out before revenue arrives	Staged investment, training fees as early income	🔴 (High)
Technology change (AI)	Our testing methods become outdated	Small R&D budget, update the curriculum yearly	🟡 (Medium)
Customers	Too few orders in year 1	Pilot projects with one or two partners, sign letters of intent first	🟢 (Low)

5. Common Company Information

Item	Draft
Company name	
Mission	Help Taiwan's semiconductor industry grow faster by training talent and testing AI chips with smarter inspection.
Services	AI inspection and testing service; talent training programs
Customers	Testing and packaging firms, IC designers, universities and schools
AI branch	Tests AI models on chips supplied by partners such as TSMC and detects defects automatically
Training branch	Courses and internships for students who may join the industry later
Revenue	Testing service fees, training tuition, company-sponsored training contracts
Investment requirements	Equipment, lab space, software, staff salaries, first-year operating cash
Competitors	Winstek, ASE, Sigurd, PTI, KYEC
Market gap	Existing firms focus on packaging and testing. Few offer integrated AI testing and talent training.

Item	Draft
Ownership / shares	Example: founders 60%, investors 30%, employee pool 10% (adjust to your team's decision)
Growth plan	Year 1: pilot with a few partners. Year 2: expand AI testing capacity. Year 3: open training in more schools and cities.

6. Industry Problems into Business Opportunities

Problem	Who has it	What companies do now	What is still missing	How we help	Who pays	Revenue
Capacity cannot keep up with demand	Chip makers, testing firms	Build new fabs and lines	Faster, automated testing	AI inspection speeds up testing	Testing and chip firms	Per-chip or per-batch service fees
Talent shortage and crowding-out	All semiconductor firms	Recruit from universities, raise wages	Job-ready graduates	Training center	Companies, students, schools	Tuition and sponsored programs
Defects and quality issues	Manufacturers	Manual and standard inspection	Faster, more accurate detection	AI inspection service	Manufacturers	Subscription or per-project fee
Geopolitical and material risks	Whole supply chain	Stockpile, diversify suppliers	Data-based risk monitoring	Monitoring and planning support (optional service)	Large firms	Consulting or report fees
Competition and self-reliance push	Taiwanese firms	Invest in R&D	Local specialists and testing capacity	Local talent and test services	Industry partners	Service contracts

7. Answers to Difficult Investor Questions

What if a larger company copies you?

Big firms are built around packaging and testing at scale, while our edge is the combination of AI testing and a student talent pipeline. Partnerships with schools and early customers are hard to copy quickly. We could also partner with the larger company instead of competing.

What if customers do not come?

We start with a small pilot and sign letters of intent before investing heavily. Training fees give us income even while testing customers are still growing.

What if equipment is too expensive?

We start with a small lab and lease or share equipment. We buy more only when orders justify it.

What if you cannot find engineers?

That is why we run our own training center. We build our own pipeline through industry-academia collaboration and can recruit overseas talent as a backup.

What if AI technology changes?

We keep a small R&D budget and update our methods and courses every year. Training also keeps our own team current.

What if semiconductor demand falls?

The training branch and the testing branch earn money differently, so a drop in one does not stop the other. We can reduce hiring and equipment purchases during slow periods.
